

POLY EXEA

Mumbai Example: Real World Strategy Scenarios

BUSINESS REQUIREMENT	WHAT POLY EXEA DOES
2,000,000 barrels of crude to Mumbai Deadline: 15 days Hormuz unavailable Supply: Saudi Arabia + West Africa Constraint: no single transport option above 40%	It does not stop at “find another route”. It searches the wider physical and commercial network for ways to satisfy the Mumbai requirement, then compares feasible combinations.

How to read the examples

The country and port names below are real. Where the example describes a vessel opportunity, the vessel movement is an illustrative AIS scenario, not a claim that a particular ship currently has spare cargo space. Poly Exea treats AIS as evidence of movement, then asks for commercial verification before using capacity in the optimizer.

Step 3: Strategy discovery with real geography

01 ALTERNATIVE ROUTE

Real world example

Example: Saudi Arabia → Yanbu → Red Sea → Suez/SUMED → Mediterranean → India

How Poly Exea uses it

Saudi Arabia has used its East West pipeline to move crude to Yanbu on the Red Sea, and Saudi crude has also been rerouted through Egypt's Sidi Kerir and the SUMED system during disruption periods. For a Mumbai requirement, Poly Exea can compare a Red Sea/Suez path against a Hormuz dependent path.

Benefit

Benefit: the business can avoid the disrupted Gulf chokepoint, while the engine measures the cost and time of the longer route.

02 PIPELINE BYPASS

Real world example

Example: Habshan, UAE → Fujairah, UAE → tanker → Mumbai

How Poly Exea uses it

The UAE's Abu Dhabi Crude Oil Pipeline runs from Habshan to Fujairah, bypassing the Strait of Hormuz. Poly Exea can treat this as a real physical alternative: move crude by pipeline to Fujairah, then continue by vessel toward Mumbai.

Benefit

Benefit: the critical Gulf segment is moved off the sea leg and can reduce exposure to the chokepoint.

03 REPLACEMENT SUPPLY

Real world example

Example: West Africa or another non Hormuz source → Mumbai

How Poly Exea uses it

Suppose 1,000,000 barrels originally expected from Saudi Arabia cannot reach Mumbai on time. Poly Exea can search for a replacement cargo from West Africa or another compatible source and compare its product cost, freight, ETA and risk against waiting for the original barrels.

Benefit

Benefit: the company solves the supply requirement even if the original physical cargo cannot move.

04 MOVING VESSEL OPPORTUNITY

Real world example

Example: tanker moving Japan → Singapore → potential relevance to Mumbai

How Poly Exea uses it

Imagine the AIS feed shows a crude tanker leaving Japan and moving toward Singapore. Poly Exea can calculate whether the vessel's current position, declared destination and future geography make it relevant to the Mumbai requirement. It then creates a candidate opportunity. The platform does not assume the vessel has spare space. The owner or broker must confirm capacity, diversion ability, laycan, cargo compatibility and price.

Benefit

Benefit: Poly Exea may discover an already moving asset that could become useful instead of starting from zero with a new charter search.

05 BACKHAUL

Real world example

Example: China → Middle East delivery, then repositioning toward India

How Poly Exea uses it

Imagine a tanker has delivered crude into China and is scheduled to reposition west. If the return movement can pass through a commercially useful corridor for Mumbai, Poly Exea can ask whether a compatible cargo can be placed on that movement. The shipowner confirms whether the vessel is commercially available and at what rate.

Benefit

Benefit: an existing repositioning movement can potentially become productive cargo movement, lowering incremental freight and improving vessel utilization.

06 TRIANGULATION

Real world example

Example: Saudi Arabia → Singapore → Mumbai

How Poly Exea uses it

Suppose one vessel is already moving Saudi crude toward Singapore while another commercial movement is available from Singapore toward Mumbai. Poly Exea can test whether the two legs can be connected through a compatible cargo transfer or delivery arrangement. It compares the total cost and time of the connected network against a direct voyage.

Benefit

Benefit: the system can use several existing movements as one solution, reducing repositioning and finding options a direct route search may miss.

07 CARGO OR DELIVERY SWAP

Real world example

Example: Saudi cargo for Company A + compatible Mumbai inventory held by Company B

How Poly Exea uses it

Company A has crude in Saudi Arabia but needs barrels in Mumbai. Company B has compatible crude near Mumbai but needs equivalent supply elsewhere. Poly Exea can identify a potential delivery swap: Company B serves Mumbai while Company A supplies the other location, subject to commercial agreement, grade matching and title terms.

Benefit

Benefit: the original barrels do not have to travel the full distance to Mumbai. The commercial structure changes the physical movement.

08 REGIONAL EXCHANGE

Real world example

Example: Mumbai storage/refinery inventory → immediate customer supply; remote supply replaced later

How Poly Exea uses it

Imagine a company or refinery near Mumbai already has compatible crude in storage. Poly Exea can evaluate using that inventory now and replacing the equivalent quantity at the other location later. The immediate requirement is satisfied without waiting for the disrupted cargo.

Benefit

Benefit: faster fulfillment when local or regional inventory can substitute for delayed long haul supply.

09 TRANSSHIPMENT

Real world example

Example: VLCC outside a restricted port → STS/feeder tanker → Mumbai

How Poly Exea uses it

If a very large crude carrier cannot efficiently complete the final delivery because of draft, berth or network restrictions, Poly Exea can evaluate a transfer to a smaller tanker at a suitable location and then complete the last leg to Mumbai.

Benefit

Benefit: vessel size and port constraints do not automatically block the supply chain.

10 HYBRID STRATEGY

Real world example

Example: 40% UAE pipeline bypass + 30% replacement supply + 20% verified backhaul + 10% regional exchange

How Poly Exea uses it

Poly Exea can combine the best verified opportunities instead of selecting one route for everything. The optimizer checks whether the mix covers the full 2,000,000 barrels, meets the 15 day deadline and respects the 40% concentration limit.

Benefit

Benefit: diversified strategies can balance cost, speed, risk and capacity more effectively than a single route.

Why these are not just route lines

LIVE / REFERENCE DATA AIS, pipelines, ports, market data	OPPORTUNITY Potentially useful movement, supply or exchange	COMMERCIAL CHECK Capacity, price, grade, timing, willingness	OPTIMIZER Only feasible verified options enter the mathematics
--	---	--	--

Example final strategy board for Mumbai

STRATEGY	EXAMPLE MIX	WHY IT MAY WIN	STATUS
Pipeline + replacement	60% + 40%	Bypass + diversify	Candidate
Backhaul + replacement	40% + 60%	Use existing movement + new supply	Verification required
Triangulation	Connected legs	Use multiple existing movements	Verification required
Delivery swap	Counterparty dependent	Avoid long haul movement	Commercial verification required
Moving vessel	Capacity dependent	Use relevant vessel already moving	Commercial verification required
Hybrid	Several options	Balance cost, ETA and risk	Optimizer candidate

The core idea in one picture

Evidence note: Real world infrastructure and disruption examples in this document are based on current public reporting and IEA material as of August 2026. Illustrative vessel examples use real countries and routes but do not assert that a particular vessel has spare capacity. AIS is movement data, not commercial capacity data.
